## DETAILED ACTION

### ***Response to Arguments***

1. Applicant's arguments have been fully considered and are persuasive. The rejection of claims 1-3,5-7,10-12,14-16,19-21, and 23-25 has been withdrawn.

The examiner notes that the applicant has argued that the combination of Gongwer, Alegre, and Hoang disclose of a system that "facilitates sharing a context between multiple independent clients." The examiner agrees with the applicant's interpretation of the combination of teachings, however the applicant has stated that "the present invention does not allow sharing" in which the examiner would like to clarify the record. The applicant's disclosure does involve sharing a security context, but not among multiple clients. The applicant's disclosure recites of sharing a security context between different sessions on a database server (page 1, lines 24-25) and the application client can use the same security context through a second application (page 4, lines 17-18). The examiner notes that the difference is that the applicant's teachings recite of a client sharing the same security context for multiple applications and the combination of the teachings of Gongwer, Alegre, and Hoang differ in that the context is shared by multiple clients.

### ***Allowable Subject Matter***

2. Claims 1-3,5-7,10-12,14-16,19-21, and 23-25 allowed.
3. The following is an examiner's statement of reasons for allowance:

It was not found to be taught in the prior art of looking up an identifier for a given application client that identifies a client of an application, wherein the identifier for the given client identifies a user of the application that is sending the request to the database. The identifier is used to lookup a security context for the given application client, wherein the security context includes attributes related to the given application client. The given application client uses the same security context through a second application and second database session wherein the identifier is used to look up the security context for the given application client.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

### ***Conclusion***

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Nevarez et al, U.S. Patent 6,189,103 discloses of existing user rights database is used for defining security contexts for tasks submitted by a user.

Chandra et al, U.S. Patent 6,058,389 discloses of messaging queuing in a database system the same security context as the process or application issuing requests.

Art Unit: 2131

Swift et al, U.S. Patent 5,768,519 discloses creating security contexts for an individual account and merges source domain information with a target domain to consolidate records.

Van Dyke et al, U.S. Patent 5,708,812 discloses creation of security context information, stored in a database, and used for a user or service accessing a network resource, provided to a server that determines whether or not to grant access to the requested resource.

Held et al, U.S. Patent 5,699,518 discloses of a security context that is used by a computer system to ensure that particular code can access data, code, and system resources that require predetermined levels of access before granting access.

Brown, "Remote Passphrase Authentication Part Two: HTTP Authentication Scheme" discloses of security context attributes that are server assigned.

"Component Object Model, Part II: Programming Interface" discloses of independent client/server connections wherein the clients are prevented from accessing each other's data and the system cannot start another session on another machine without the proper credentials and all servers that run the client security context run where their client is running.
